

Autism

Autism is a lifelong developmental disability characterized by persistent differences in communication, interpersonal relationships, and social interaction. Among other traits, some with autism are unable to talk or have atypical speech patterns, trouble understanding nonverbal communication, and difficulty maintaining a typical back-and-forth conversational style. People with autism may use behavior such as yelling, pushing or running away due to frustration at being unable to communicate. This behavior can interfere with their ability to participate in life activities and may be challenging for those around them. Approximately 75 million worldwide have autism, signs of which often appear by age two or three.
